Ok, we're still looking these over and trying to figure out what is going on. Unfortunately, we've found some discrepancies that we're going to need to figure out and clear up, and may need revised invoices to clear up our paperwork. For instance, there are overlapping invoice dates -- invoice 35 is for period 3/1/2011 - 3/31/2011, while invoice 36 is for 3/17/2011-4/17/2011.

Additionally, going back through my own email on this, I'm seeing we had missing payment issues from 2010 which I believe should have been resolved, but I wonder if what really happened is payments from 2011 were credited to 2010 instead.

I've also forwarded everything along to be investigated further here, and will let you know when either more information is needed or is available.

Kelly,

I am The Tor Project's CFO and was hoping you could help. We are closing out our books for the year and we seem to be missing payments for some of our invoices for 2011. I have attached all the invoices for 2011 and a statement showing how we applied the payments. Would it be possible for you to look into your records and see if you had received all of our invoices? We seem to be missing \$45k (or three invoices) worth of payments?

Thanks, I appreciate any help you can provide.

Hello Kelly,

Melissa and I were closing out our last contract today. We notice we're missing \$15,000 somewhere. Who can we work with on your end to figure out if we missed an invoice, or a payment got crossed up somewhere?

Thanks!

Andrew: see the tor-jobs mail today suggesting 4pm EDT for the irc interview for one of our project coordinators.

So assuming all three of my Wednesday meetings are an hour at most (2pm to meet with Tor people about this grant, 3pm to talk to Kelly at ths grant, 4pm for the interview), they'll fit.

Thanks!:)

> What has been the reaction to it?

No reaction yet, as it's still "under review" by the program committee. It is likely that it will be rejected the first time around -- we submitted it to a conference that gets lots of good papers, so it will probably take a few tries at throwing the darts before one of them sticks.

As to the internal reaction, a) no reaction since we're working full tilt on bridges and protocol normalization and haven't stopped to think about this, and b) our simulations weren't as realistic as I think they should be to convince me that it will actually work; so I'm figuring for the next iteration of the paper (in a month or two -- we hear whether it was accepted or rejected on Janury 25), that's the next step to focus on.

But first, bridges. :)

I'm happy to talk to Sarah and find out more about what topics will likely work.

In summary, all technologies are dual use. Generally, the good uses outweigh the risks incurred in the technology existing. This is true for digital cameras (#1 tech used for child porn), interstate highways (#1 transport route for kidnappers, bank robbers, or drug smugglers), and plastic kitchen utensils (#1 cause of injuries in prisons).

And yes, we've spoken to the US AID, State, National Security Staff at the Whitehouse, FBI, DoJ, DoD, and introduced tor to OFAC at the US Treasury.

> If you have any questions, please contact either myself or Demetria.

Hi Kelly,

I've been calling Demetria back periodically, but I haven't managed to get ahold of her yet.

I'm not sure what the deal is with the DUNS number. Wayne asked me to get one for this contract, so it's quite possible something isn't right about it. Do you know what company name is on the DUNS number instead -- perhaps there is a spelling mistake or something?

I'm happy to get a new DUNS number if you think that would work better.

(In the interest of completeness, the number in question is (b) (6)

Ok. I just got off the phone with D&B. Apparently they had the company name as "Dingledine, Roger", and an alternate name as "Morio Research Labs" (sic).

So I had them correct the company name to "Moria Research Labs", and I'm listed as the owner.

They say that in 24 hours it should all be updated. We will see. :)

Sounds good. I seem to have spent this weekend getting the flu, so I figure I should wait til the fever dies down before making a decision for sure. I'll aim to give you an answer Monday night.

On initial reading, the only thing that comes to mind is that we should add the phrase "or adapt" in C.2.17 -- we're still hoping the best way to do translations is to locate and adapt already-existing tools and websites.

Ok. I looked through all of them, and tried to figure out how to allocate 180k to get the right combination of "focusing on new items" and "maintaining old items". Basically it means that most previous directions are unfunded. :(

Here's the first go at a breakdown:

- C.2.1 is basically "do more to make tor useful for clients". We can and should do basic maintenance work here. \$10k
- C.2.2 has morphed into "explain our design documents and other written plans as we produce them". We should keep doing that. \$10k
- C.2.3 and C.2.4 are eclipsed by C.2.12 ("bridge relay and bridge authority work"). We ought to do basic maintenance on these features, and will try to fit it in, but I guess there's no money for this yet. \$0
- C.2.5 ("Make sure Tor doesn't get blocked by its TLS handshake") is basically done, insofar as we haven't been blocked since we made our changes, and we have a roadmap for how we think the next iteration of the arms race will go. If Tor actually does get blocked in any of the target countries, we'll have to chat again and see where our priorities should be.
- C.2.6 and C.2.7 are eclipsed by C.2.13 ("make Tor scale better to many relays"). The new four items are further work in this direction, so we'll still be giving attention to this task by doing the new items. \$0
- C.2.8 and C.2.9 ("work with other IBB contractors") are basically obsolete, since we scrapped the plans to work with Bennett et al several years ago.

 \$0
- C.2.10 ("Tor advocacy, education, and awareness") still needs to happen, or we will lose momentum within our various communities. We should focus on this still. \$20k
- C.2.11 ("Improve the ease of use of Tor for end users by continuing research and development") sure is a broad-sounding topic. We've made good progress overall. It has morphed over the past year into "Preconfigured privacy (circumvention) bundles for USB or LiveCD". In an ideal world we'd work on a TBB for Linux, to handle the new China cafe situation. But

I guess not this year. \$0

- C.2.14 ("Incentives to run relays") still needs attention, as part of the performance work, but it'll be on the back burner for now. \$0
- C.2.15 ("More reliable download mechanism for TBB users on slow connections") is mostly working, insofar as we have an email autoresponder and we've been dabbling in split downloads. The real answer is to adapt our Thandy secure updater to be able to start with a tiny program and fetch the rest. But that will have to wait.
- C.2.16 ("Evaluate and reduce trace footprint by Tor Browser Bundle"): we solved the tractable issues, and we made a list of the remaining issues that are due to how Windows works. That will have to do for now. \$0
- C.2.17 ("Web-based portal to manage translations") is mostly self-running at this point, though it would be nice to put more energy into maintenance, keeping up-to-date with the software, fixing bugs, etc. We also really ought to work on better documentation to help people use it successfully; but I guess that will come later too. \$0
- C.2.18 ("Proposal 158 and whatever comes next").
- C.2.19 ("Squeeze loud circuits") 50k
- C.2.20 ("Tor Weather features and integration") 20k
- C.2.21 ("Bandwidth and load balancing to improve performance") 50k

Whew. Let me know what you think.

Now the next challenge on our side is to figure out the right balance of cutting funding for our current developers (and thus slowing down progress in general) vs going out on a limb and figuring that we can find another funder to make up the difference (and/or hoping that the rest of your budget will come through).

I think our current plans are to keep at it for the next quarter under the assumption that everything will work out; and then reevaluate after that if it doesn't.

Thanks, --Roger

Hi Kelly,

Looks good overall. I'm confident we'll have good answers for the first three in the period of the contract. I think C.2.19 has the potential to make a really sweeping change in performance. (Or I'm just wrong and it won't have much of an impact.)

The fourth item (C.2.21) is a bit tricky. We don't yet know what design we want to have in mind, so I don't know how straightforward it will be to deploy whatever we end up having in mind. But we will definitely deploy *something*, and I figure as long as I keep you informed about what we're up to and what we're thinking and what we're trying, it will all work out.

So, in summary: these four look like good additions, and are worth doing. Let's do it.

But I should also note that they'll use up most of the 180k, meaning we can't focus on the new four and also make good progress on the contract items from previous years. It'll be more "focus on the new four and do some maintenance work on the items from previous years".

I've started looking over the previous contract terms for completeness, but I'll send that in a different mail.

Thanks!

Hi Kelly,

How's this going? Our IBB contract expired Apr 17, so we're now running on "interim" time. Anything we can do to move things forward?

Thanks!

Andrew - thanks very much.

Karsten - as Andrew stated, we don't want or need any PII, just enough for a virtual dog and pony show.

"If you want "live" statistics per country, can you visualize how many relays we have per country at a given time of day instead? This information is not available in the database yet, but I could implement it quite soon."

This looks good, and one could update it every hour, presumably, if you feel the implementation would not be over burdensome.

Kyle - pls touch base with Kasrten to see how we can utilize their stats, in the exact technical sense.

Ken

Hello Kelly, Sho, and Karsten,

Consider this a virtual introduction to one another. As promised, here an introduction to Karsten Loesing from Tor. Karsten is the developer, statistician, and maintainer of the https://metrics.torproject.org website.

Karsten, as we've discussed in the recent past, Ken and Kelly need to put on a show for some of their funders in the US Congress.

Kyle and Sho were interested in the csv files and understanding what's there. An idea is to take the last 24h of data and play it back, so they can visualize where tor users are coming from throughout the day on a world map.

Ken, Kelly, and Sho, I don't have Kyle's email address. Please forward this to him as he was most interested in the csv files.

Thanks!

Andrew is right. Kyle, can you use these CSV files for your visualization? They are updated automatically, so if you refresh them, say, once per day, you'll have the most recent data on Tor usage by country.

Also, in separate mail you wrote:

- > I am looking at google map API and thematic-mapping API.
- > I downloaded the engine and looking at source code

- > you made the map so quick
- > I was wondering to know, Do you have any manual or resources that can

Roger and I discussed this today. We're in California right now, so sorry for the delayed response.

We don't have any real-time tor network data by design to protect the anonymity of our users. Everything is done over a batch process on a 24-48 hour cycle.

The best idea we can come up with is to setup vidalia, open up the Network Map and Bandwidth Graph and make the tor client do something. This shows circuits moving around the world and bandwidth being used.

We can come up with some wilder ideas that we can't do ourselves for lack of skills, but the data is available. These are:

- showing the growth/change of tor relays by country over some period (months, years) from the consensus archives.
- showing the growth/change of tor bridge users by source country over some period (months, years) from the bridge archives.
- take the individual country graphs from metrics.torproject.org per day, and turn it into an animated image which "plays" through the data for some period.

Dear Karsten,

We had a meeting on Friday and we decided to use Thematic Mapping.

Here the summary:

About Tor data: we would like to have weekly usage number and we are fine with 1 (or two) day old data.

We want to see tor usage from China, middle eastern countries, Vietnam,... so U.S. Tor usage is not necessary and should be removed.

- -If there no data for a country, please enter a small number (or a multiple of a number) so the countries border will be recognizable
- -Is there possibility of world map rotation?

Thanks Kyle

Here's a prototype of the Thematic Mapping API for daily Tor users:

http://178.79.156.117/

This protype shows daily Tor users on March 9, 2011. We could extend the web page to let the user configure what data to display, e.g., data from a different day, monthly averages, monthly peaks, etc. So far it's just a proof of concept.

As the page says, please use this link only internally until we figured out any license questions. Also, we might take that prototype offline in, say, a week from now (March 18).

Let's ignore the technical details of fetching the data in real-time. That can be solved.

The more important question is whether you need real-time data about the people using Tor, Psiphon, etc. _right_now_, or if you're fine with 1 or 2 day old data. As I said, real-time data of Tor usage is not available and would pose a privacy risk for our users. But if you want to show usage in general, that doesn't need to be real-time data, correct?

> -I am thinking to have the program set and running in a week or two, > hopefully!.

Okay. As soon as you know what data you need from Tor's side, please let me know!

Best, Karsten

Hello Kelly,

Where are we at with this real-time demo? I see a long thread between Karsten and Kyle. Karsten did a bunch of work to make Kyle's job easier, but we haven't heard back from Kyle. Karsten even created as close to a real-time demo as we're going to get and shared the url and code with Kyle.

I'm not sure what we can do next, short of flying Karsten over from Germany and sitting him in front of Kyle for a few days.

Thoughts?

Here's a prototype of the Thematic Mapping API for daily Tor users:

http://178.79.156.117/

This protype shows daily Tor users on March 9, 2011. We could extend the web page to let the user configure what data to display, e.g., data from a different day, monthly averages, monthly peaks, etc. So far it's just a proof of concept.

As the page says, please use this link only internally until we figured out any license questions. Also, we might take that prototype offline in, say, a week from now (March 18).

Let's ignore the technical details of fetching the data in real-time. That can be solved.

The more important question is whether you need real-time data about the people using Tor, Psiphon, etc. _right_now_, or if you're fine with 1 or 2 day old data. As I said, real-time data of Tor usage is not available and would pose a privacy risk for our users. But if you want to show usage in general, that doesn't need to be real-time data, correct?

> -I am thinking to have the program set and running in a week or two, > hopefully!.

Okay. As soon as you know what data you need from Tor's side, please let me know!

Ms. Karsten,

-Yes, I installed Thematic Mapping API and I' m testing on it. Thanks for the info

I am looking at 2-3 different programs now, Hopefully in a week or two we can come up

with best option that satisfy our requirements.

-About Live report: main idea was to have a program/tool set and running that have instance access to

Tor (and Pshiphon, free gate) servers and fetch the data (user usage in each country) and

then graph it on a word map but as I see it is too hard to implement without database connection.

Maybe I can go with the daily or weekly manual update (a CSV file) for now.

-I am thinking to have the program set and running in a week or two, hopefully!.

Thanks

Sounds like the Thematic Mapping API could do what you want. Did you try it? There are a few examples on the website. I like the prism map, and the choropleth map looks quite useful, too.

http://thematicmapping.org/api/prism.php

http://thematicmapping.org/api/choropleth.php

Note that you might have to install the Google Earth plugin to view these links. But this shouldn't be an issue for the presentation, right? As an alternative, you might be able to load the data into Google Earth instead of a browser. These are things we could figure out somehow.

When you say "live report," what does this mean? As discussed earlier in the thread, there's no live usage data of Tor, because that would hurt our users' privacy. But do you really need live data for this presentation? Wouldn't it be just as useful to allow your visitors to navigate usage over the past year or two?

Also, when's the presentation?:)

No, it is not a one time presentation

If it was slideshow or something animated, it could be so easy!

We plan to have a computer with a nice big screen installed on a wall. Visitors can see

live report of Tor, PsiPhon usage around the world on the screen.

It's still unclear to me what kind of presentation you're planning. Is the presentation running unattended in an endless loop? If so, do you need something animated, or would it be sufficient to make a slideshow of interesting graphs? Or are you going to set up a terminal with a mouse or touch screen and let people navigate the data?

Also, when's the presentation?

Here's an alternative to the tool you mention above:

http://thematicmapping.org/

This tool is powered by Google Earth and runs inside a browser that has the Google Earth plugin. We started looking into this tool one week ago and plan to set up a prototype with Tor data. I cannot promise we'll get this running (in time), but if we do, would this be useful for you?

There are 4 vendors that provide 3 different file format, CSV, TXTand pdf but I think we should go with CSV format finally. I am looking for a program that goes to the server and fetch CVS file and graph it for us. I found this program

http://www.sacmeq.org/statplanet/StatPlanet.html

But the problem is it reads the data from CSV file locally.

I know some about Crystal report program it is a powerful tool. I am trying to learn more
I will talk to Media group over here maybe they have other ideas. I will keep you all posted.

The number in the CSV file I suggested is the number of running relays in that specific country at the given time.

- > Karsten, I am thinking to write a code in a scripting language (such as
- > Ruby).
- > code connect to the database every hour, fetch the cvs file and graph the
- > bars on screen
- > mainly for the countries we are more interested to see (such as Iran,
- > China, Vietnam,..)

>

> What do you think?

From a technical POV, this should work fine. I'm going to tell you an HTTP address where you can request the CSV file every hour. But I doubt there will be many relays in Iran/China/Vietnam.

An alternative would be to give up the real-time requirement and graph users from Iran/China/Vietnam with a 2-day delay similar to our graphs here:

https://metrics.torproject.org/users.html

The CSV files for these graphs are already available. See the links on that page.

I could try to reduce the 2-day delay to something around 24 hours, but that's going to be difficult with our current database and aggregation method. Also, the result would be a 24-hour rolling average which doesn't have any visible daytime patterns. I'm not sure how suitable that would be for your presentation.

When's your presentation?

I just opened an item in our bug tracker that contains a description of the CSV file I have in mind. Please ignore the implementation details. Would that file, when updated every hour, be useful for you?

https://trac.torproject.org/projects/tor/ticket/2512

Feel free to add a comment in the bug tracker or reply here.

Sure, I'm happy to help with explaining the current csv files. Which ones are you interested in?

Also, it's quite easy to add new csv files if required. You might want to take a look at our recently published "Overview of Statistics Data in the Tor network" to get a rough idea what data is available:

https://metrics.torproject.org/papers/data-2010-12-29.pdf

The idea of visualizing where Tor users are coming from throughout the day is somewhat problematic, though. We don't collect the information at what time of day people are using the Tor network, because it might be too sensitive. We sum up requests over 24 hour intervals and only visualize those.

If you want "live" statistics per country, can you visualize how many relays we have per country at a given time of day instead? This information is not available in the database yet, but I could implement it quite soon. I could imagine we have a daily pattern of relays per country similar to the number of running relays per time of day:

 $\frac{https://metrics.torproject.org/network.html?graph=relayflags&start=2011-01-30\&end=2011-02-06\&flag=Running&granularity=hour&dpi=150\#relayflags$

Please let me know what would be most useful for your presentation.

Hello Kelly, Sho, and Karsten,

Consider this a virtual introduction to one another. As promised, here an introduction to Karsten Loesing from Tor. Karsten is the developer, statistician, and maintainer of the https://metrics.torproject.org website.

Karsten, as we've discussed in the recent past, Ken and Kelly need to put on a show for some of their funders in the US Congress.

Kyle and Sho were interested in the csv files and understanding what's there. An idea is to take the last 24h of data and play it back, so they can visualize where tor users are coming from throughout the day on a world map.

Ken, Kelly, and Sho, I don't have Kyle's email address. Please forward this to him as he was most interested in the csv files.

Thanks!

Roger and I discussed this today. We're in California right now, so sorry for the delayed response.

We don't have any real-time tor network data by design to protect the anonymity of our users. Everything is done over a batch process on a 24-48 hour cycle.

The best idea we can come up with is to setup vidalia, open up the Network Map and Bandwidth Graph and make the tor client do something. This shows circuits moving around the world and bandwidth being used.

We can come up with some wilder ideas that we can't do ourselves for lack of skills, but the data is available. These are:

- showing the growth/change of tor relays by country over some period (months, years) from the consensus archives.
- showing the growth/change of tor bridge users by source country over some period (months, years) from the bridge archives.
- take the individual country graphs from metrics.torproject.org per day, and turn it into an animated image which "plays" through the data for some period.

We don't have anything realtime, as metrics.torproject.org is batched daily. When would you want this, if we could do it?

For demonstrations, I have my rss reader running every minute making lots of connections to create some activity and make the Network Map and Bandwidth Graph move. Or just fire up bittorrent and download a variety of files to create the traffic (not that I condone that, but downloading all of the tor videos from media.torproject.org works well to create some activity).

Pie.html World.html

Good morning Karsten

Yes, CSV files are fine and I can access them on Tor website.

I used google Virtualization API and came up with two examples that we like (see attachments). Java script plus google virtualization GeoMap make beautiful graphs.

I am working on instance update now. I found out I can use Google doc and make the code to connect to the google.doc (in this case, a spreadsheet) so as soon as spreadsheet cells change or update; the map will be updated as well. In this way, we can reach our goal to have (as close as) live status.

Thanks

I just opened an item in our bug tracker that contains a description of the CSV file I have in mind. Please ignore the implementation details. Would that file, when updated every hour, be useful for you?

https://trac.torproject.org/projects/tor/ticket/2512

Feel free to add a comment in the bug tracker or reply here.

Best, Karsten

We don't have anything realtime, as metrics.torproject.org is batched daily. When would you want this, if we could do it?

For demonstrations, I have my rss reader running every minute making lots of connections to create some activity and make the Network Map and Bandwidth Graph move. Or just fire up bittorrent and download a variety of files to create the traffic (not that I condone that, but downloading all of the tor videos from media.torproject.org works well to create some activity).
